BALTO-SLAVIC ACCENTUATION: SOME NEWS TRAVELS SLOWLY

Since 1973 I have been advocating the view that the Balto-Slavic acute tone was in fact glottalic and has been preserved unchanged in originally stressed and unstressed syllables in Žemaitian and Latvian, respectively (e.g. 1975, 1977, 1985, 1998). Jay Jasanoff has now (2004) adopted the gist of my view, but without mentioning my name. It may therefore be useful to sketch the background of our differences and to point out the remaining discrepancies.

More than twenty years ago there was a discussion between Jasanoff (1983) and Schmalstieg (1983) about final syllables in Slavic. As I pointed out in my comment (1983), the discussion was strongly reminiscent of the one which almost a century earlier took place between Streitberg (1892) and Hirt (1893), the former author insisting upon tonal distinctions and the latter upon the place of the stress for the explanation of timbre distinctions in final syllables. In his contribution, Jasanoff came up with solutions that had been proposed eighty years earlier by Holger Pedersen (1905) in an article which he evidently had not seen. Some news travels slowly.

In the meantime our knowledge of Slavic accentuation has increased dramatically (cf. Kortlandt 1979 for an introduction). It should be clear by now that there is no evidence for an original prosodic distinction between Indo-European acute and circumflex syllables either in Indo-Iranian, where a hiatus represents an intervocalic laryngeal, or in Greek, where an original circumflex reflects an earlier hiatus from a lost intervocalic laryngeal, or in Germanic, where the difference between short and long reflexes is fully explained in terms of segmental features and well-motivated analogical developments, or in Balto-Slavic, where the acute is a broken tone reflecting Indo-European laryngeals and preglottalized stops (Winter’s law) and the circumflex represents lengthened grade and contractions (cf. Kortlandt 1986 for discussion). One may therefore wonder about the motivation for Jasanoff to stick to the neogrammarian assumption of tonal distinctions and to ignore the contrary evidence.

While twenty years ago Jasanoff still invoked a circumflex gen.pl. ending *-öm for Indo-European in order to account for the disyllabic scansion in Vedic -ām (-aam), the circumflex tone in Greek -ōn, and the long -o in Gothic feminines and
elsewhere in Germanic and was eager to find a new way around the Balto-Slavic counter-evidence (1983, 187), he has now (2004, 248f.) abandoned the first two pieces of evidence and limited the argument to the Germanic ending. In fact, all Indo-European languages except Greek point to a short gen.pl. ending *-om. Since I have discussed the gen.pl. ending in detail elsewhere (1978, see also 1983, 170-174), I shall not take the matter up again here. Suffice it to say that Jasanoff has not answered the points which I raised in connection with the Germanic data (ibidem). Nor shall I discuss Jasanoff’s arbitrary reconstructions *-o and *-ôn for the masc. nom.sg. ending of Old High German gumo and Gothic guma, respectively (2004, 250).

For Balto-Slavic, Jasanoff now assumes that the loss of the Indo-European laryngeals yielded new long vowels which were subsequently shortened with concomitant glottalization, thus giving rise to a “broken tone” (2004, 251). This superfluous assumption of lengthening and subsequent shortening gets him into difficulties because earlier long vowels (from lengthened grade and contractions) remained distinct from the new long vowels (which arose from the loss of the laryngeals). Jasanoff partly remedies these difficulties by assuming an additional series of lengthenings of earlier long vowels, yielding “hyperlong” vowels. These lengthenings concern (1) long vowels from contractions after the loss of an intervocalic laryngeal (corresponding to the Indo-Iranian hiatus and the Greek original circumflex), then (2) lengthened grade vowels in “absolute final position” which allegedly received an “extra mora of length” following a special ad hoc rule which supposedly operated in both Germanic and Balto-Slavic in order to account for such instances as OHG gumo (but not Gothic guma) and Lith. akmuo and duktē (Jasanoff 2004, 249f.), then after the rise of glottalization (3) Lith. long vowel preterits such as ėjo and srēbė “under the influence of related forms” (Jasanoff 2004, 252), then (4) Lith. i- and u-diphthongs in final syllables which were not monophthongized such as dat.sg. -u < *-ōi and inst.pl. -ais < *-ōis, and (5) vowels and diphthongs in Slavic mobile paradigms. In spite of the exceedingly high number of special assumptions, there remain a substantial number of counter-examples which Jasanoff does not discuss.

The fact of the matter is that the glottalic feature of the Balto-Slavic “broken tone” is the phonetic reflex of the Indo-European laryngeals (and preglottalization) and that original long vowels (from lengthened grade and early contractions) simply remained long vowels and never became acute. It follows that Jasanoff has missed the following categories (cf. Kortlandt 1986, 154f. and 1997, 26):

(1) Lengthened grade vowels before final resonants which were not lost, e.g. Latvian ābuōls ‘apple’, SCr. žērāv ‘crane’, Czech žerav. These words represent the same category as Lith. akmuo ‘stone’ and duktē ‘daughter’.

14
(2) Lengthened grade vowels in the sigmatic aorist, e.g. Scr. 1st sg. dônijeh beside donësoh 'brought', ümrijeh 'died', zãklëh 'swore'. This category is reflected in the East Baltic long vowel preterit, e.g. Lith. srëbë 'sipped', cf. Vedic āsrāk 'emitted'.

(3) Lengthened grade vowels in original root nouns, e.g. Lith. gëlå 'pain', žolë 'grass', mêsà 'meat', Scr. řiçeç 'word', ěår 'magic', sâm 'alone', Czech ěår, čára, sám. The circumflex reflex of the lengthened grade vowel contrasts with the acute of laryngeal origin in the verb, e.g. Lith. gëlîti 'ache', Scr. žãîîti 'mourn', also Lith. žëlti 'grow'.

(4) Lengthened grade vowels before a laryngeal, which was lost. These are found in the following subcategories:

(4a) The 2nd and 3rd sg. form of the sigmatic aorist, e.g. Scr. dâh 'gave' < *dōs, lî 'poured' < *lēis, as opposed to 1st sg. dâh < *doHs-, lîh < *leHs-, cf. Vedic injunctive stošam 'I praise', jësam 'I conquer', with full grade vocalism (Kôr âlând 1987).

(4b) The metatony in the Lithuanian future, e.g. duōs 'will give', liēs 'will pour', as opposed to biûs 'will be', lis 'will rain', dialectally also žinōs 'will know', stovēs 'will stand', kalbēs 'will speak' beside rašis 'will write', daris 'will do', sakis 'will say' (Zinkëvïcius 1966, 361). The metatony reflects the loss of a laryngeal after a lengthened grade vowel in the aorist injunctive, e.g. *dōs, *lēis.

(4c) Root nouns with loss of a laryngeal after a lengthened grade vowel, viz. Latvian sâls 'salt', gûovs 'cow', cf. Lith. sólýmas 'brine'.

(4d) The Lith. nom.sg. ending -ë, which was generalized from the root noun that is represented in arklidë 'stable', avidë 'sheepfold', alûdë 'pub', pelûdë 'chaff store', cf. Vedic -dhâ, Latin -dês.

Apart from the totally inadequate presentation of the evidence, Jasânoff gives a mistaken interpretation of several Lithuanian case endings (2004, 253). He claims that dat.sg. -ui < *-ōi and inst.pl. -ais < *-ōis are “only secondarily circumflex” because the acute was lost “in final nuclei that could not be shortened to a single mora” in spite of the fact that they did not attract the stress in accordance with Saussure’s law. This is clearly wrong because the 1st and 2nd sg. endings -au and -ai did attract the stress in accordance with Saussure’s law before they became circumflex (cf. Kôr âlând 1977, 327f.). Moreover, this new circumflex is limited to a part of the Lithuanian dialects only. Contrary to Jasanoﬀ’s statement, the Lith. endings -ui and -ais are identical with their Greek cognates -ōi and -ōls.

Jasanoﬀ states that for “reasons that are still not entirely clear” pronominal nom. pl. *-oi became acute in Balto-Slavic, as reflected in Lith. gerî, gerîeji, and appears secondarily as circumflex -ai in nouns, e.g. vilkal. In fact, circumflex -ai is also found with derived adjectives in -is, e.g. auksinîiai ‘golden’, jaunûčiai ‘very young’, and dialectally in a pronominal endings. Elsewhere I have argued that circumflex -ai and
acute -ie represent unstressed masculine *-oi and stressed neuter *-aH-i, respectively (1994, also 1997, 28f.). These two endings were in complementary distribution after original barytone neuters had become masculines in Balto-Slavic. It follows that the acute reflects an Indo-European laryngeal and the circumflex its absence.

For Slavic, Jas anoff maintains that (1) “accented acute vowels came to differ from accented non-acute vowels only in their pitch contour” and (2) “unaccented acute vowels ceased to be phonetically distinguishable from non-acute vowels at all” (2004, 254). Both statements are false. As I have argued in detail elsewhere (1975, 1989), the Indo-European laryngeals remained segmental phonemes up to the end of the Balto-Slavic period, were then lost in pretonic and post-posttonic syllables in early Slavic, became a prosodic feature at the time of the monophthongizations, had nothing to do with the rise of phonemic pitch contours, gave rise to new timbre distinctions when the broken tone was lost in posttonic syllables, and eventually gave rise to short rising vowels, as opposed to long rising vowels reflecting the Balto-Slavic circumflex and falling vowels which arose in Slavic mobile paradigms. Thus, Slovene brat ‘brother’ and pot ‘way’ reflect the presence versus absence of a laryngeal (Greek phrátēr versus póntos) in the distinction between short and long root vowel, while the falling tone is found in both dār ‘gift’ and vōz ‘carriage’ (Gr. dōrōn vs. ōkhos). The distinction between acute (short) and non-acute (long) vowels in posttonic syllables is well preserved in the SCR. suffixes -at, -av, -ica, -ina versus -är, -ik, -in, -ina (cf. Dybo 1968), among other instances. Jas anoff adds that the acute was also lost in unaccented syllables in Lithuanian (2004, 254). Again, this is a simplification which holds true for the literary language, but not for the dialects (cf. Alek san d ra vivi cǐ u s 1957, Grin aveckis 1973).

I conclude that Jas anoff’s distorted picture of Balto-Slavic accentuation is a result of insufficient knowledge of the data and the scholarly literature. Some news travels slowly, alas.
